DevInfo is a powerful database system that is used to compile and disseminate data on human development. The software package has evolved from a decade of innovations in database systems that support informed decision making and promote the use of data to advocate for human development. The DevInfo project is an interagency initiative managed by UNICEF on behalf of the United Nations (UN) System.

**BACKGROUND**

DevInfo was developed by UNICEF in cooperation with the UN System to assist the UN and Member States in tracking progress toward the Millennium Development Goals (MDGs). In 2002, DevInfo was proposed as a standard software package for the whole UN System. Its specific purpose is to store existing data, identify gaps in the MDG indicators, provide a single entry point for data on the MDG indicators, facilitate access to disaggregated data and disseminate information simply and attractively.

**CAPABILITIES**

DevInfo is an integrated desktop and web-enabled tool that supports both standard and user-defined indicators. The standard set of MDG indicators is at the core of the DevInfo package. In addition, at the regional and country levels, database administrators have the option to add local indicators to their databases. The software supports an unlimited number of levels of geographical coverage: from global level to regional, sub-regional, national, and sub-national down to sub-district and village levels (including schools, health centers, and water points).

DevInfo has simple and user-friendly features that can be used to query the database and generate tables, graphs, and maps. The system provides an ideal tool for evidence-based planning, results-focused monitoring, and advocacy purposes. It allows for organizing, storing, and dissemination.

Data from DevInfo can be exported to XLS, HTML, PDF, CSV, and XML files and imported from spreadsheets in a standardized format. DevInfo also has a data exchange module for importing data from industry-standard statistics software packages such as SPSS, SAS, Stata, Redatam, and CSPro.

UNICEF developed DevInfo in cooperation with the United Nations System to monitor achievement toward the Millennium Development Goals. DevInfo is a powerful database system with simple and user-friendly features that produce tables, graphs, and maps for inclusion in reports, presentations, and advocacy materials.

In CEE/CIS, three regional databases are available. The Regional MDGInfo database, developed in cooperation with UNECE and UNDP, makes MDGs as well as regionally specific indicators easily available. The MICSInfo database presents the key findings of the third round of Multiple Indicators clusters Surveys carried out in 12 countries in the region. The MoneelInfo database makes data on the situation of children and women in the region easily accessible. For more information, visit www.devinfo.org and www.unicef.org/ceecis
In CEE/CIS the number of countries using DevInfo for monitoring and reporting increased from 11 in 2005 to 16 in 2007.

DISTRIBUTION
DevInfo is distributed royalty-free to all Member States and UN agencies for deployment on both desktops and the web. The user interface of the system and the contents of the databases it supports include country-specific branding and packaging options which have been designed to ensure broad ownership by national authorities. UNICEF has absolutely no restrictions on the database and its use.

The most common DevInfo users include UN country teams, national statistical offices, planning ministries, and district planners. Frequent users also comprise members of the media (for reporting and tracking human development data), educational institutions (for analyzing data and helping students gain data access), as well as DevInfo administrators (in particular for customizing the system or adding data through advanced database administration modules).

GOOD PRACTICES
UNICEF, in partnership with the World Bank and the International Development Evaluation Association, collected and published DevInfo good practices in the book “Bridging the gap. The role of monitoring and evaluation in evidence-based policy making”, as well as in “Enhancing evidence-based policy making through country-led monitoring and evaluation systems”. Both publications are available at www.unicef.org/ceecis

FUTURE GOALS
DevInfo will contribute to setting universal standards for data storage, access, and dissemination on human development indicators, specifically the MDGs. The long-term vision for DevInfo is for the system to make a major contribution to strengthening the processes at the country level for use of data for planning, monitoring, and advocacy. Visit www.devinfo.org for more details or to request a copy of the latest version of the software.
